

# NumPy + Pandas + Matplotlib Mega Cheatsheet

| Method          | Description   | Example   |
|-----------------|---|---|
| np.abs          | Compute absolute (positive) values element-wise.                                  | np.abs([-1, 2]) => array([1, 2])                              |
| np.all          | Check if all elements are True.   | np.all([1, 1, 1]) => True                                     |
| np.allclose     | Check if arrays are element-wise equal within a tolerance.                        | np.allclose([1e10,1e-7], [1.00001e10,1e-8])                   |
| np.any          | Check if any elements are True.   | np.any([0, 1, 0]) => True                                     |
| np.arange       | Generate values in a range with a step (like Python's range but returns an array) | np.arange(1, 5) => array([1, 2, 3, 4])                        |
| np.argmax       | Return the index of the largest value.  | np.argmax([3, 1, 2]) => 0                                     |
| np.argmin       | Return the index of the smallest value.   | np.argmin([3, 1, 2]) => 1                                     |
| np.argsort      | Return indices that would sort the array.   | np.argsort([3, 1, 2]) => array([1, 2, 0])                     |
| np.around       | Evenly round to given decimals.   | np.around([0.1234], decimals=2) => array([0.12])              |
| np.array        | Create a NumPy array from a list or tuple of elements.                            | np.array([1, 2, 3]) => array([1, 2, 3])                       |
| np.array_equal  | Check if two arrays have the same shape and elements.                             | np.array_equal([1,2], [1,2]) => True                          |
| np.array_equiv  | Check if two arrays are broadcastable and equal.                                  | np.array_equiv([1], [1,1,1]) => True                          |
| np.astype       | Convert array to a different data type.   | np.array([1.0]).astype(int) => array([1])                     |
| np.broadcast    | Broadcast object for shape alignment.   | np.broadcast([1,2], [[1],[2]])                                |
| np.broadcast_to | Broadcast array to new shape.   | np.broadcast_to([1,2,3], (3,3))                               |
| np.ceil         | Round each value up to the nearest integer.                                       | np.ceil([1.2, 2.8]) => array([2., 3.])                        |
| np.clip         | Limit values to a specified range.  | np.clip([1, 5, 10], 0, 5) => array([1, 5, 5])                 |
| np.corrcoef     | Correlation coefficient matrix.   | np.corrcoef([1,2,3], [4,5,6])                                 |
| np.cov          | Covariance matrix.  | np.cov([1,2,3], [4,5,6])                                      |
| np.cumprod      | Cumulative product of array elements.   | np.cumprod([1, 2, 3]) => array([1, 2, 6])                     |
| np.cumsum       | Cumulative sum of array elements.   | np.cumsum([1, 2, 3]) => array([1, 3, 6])                      |
| np.diag         | Extract or construct diagonal.  | np.diag([1, 2]) => array([[1, 0], [0, 2]])                    |
| np.diagflat     | Create a 2-D array with flattened input as diagonal.                              | np.diagflat([[1,2],[3,4]])                                    |
| np.diff         | n-th discrete difference along axis.  | np.diff([1, 2, 4]) => array([1, 2])                           |
| np.digitize     | Return indices of bins to which values belong.                                    | np.digitize([0.2, 6.4, 3.0], bins=[0.0, 1.0, 2.5, 4.0, 10.0]) |
| np.divmod       | Element-wise quotient and remainder.  | np.divmod([4, 5], 2) => (array([2, 2]), array([0, 1]))        |
| np.dot          | Compute dot product of two arrays (matrix/vector product).                        | np.dot([1,2], [3,4]) => 11                                    |
| np.ediff1d      | Differences between adjacent elements.  | np.ediff1d([1, 2, 4]) => array([1, 2])                        |

# NumPy + Pandas + Matplotlib Mega Cheatsheet

|                       |   |   |
|-----------------------|---|---|
| np.errstate           | Context manager for error handling.                             | with np.errstate(divide='ignore'): np.array([1]) / 0                    |
| np.expand_dims        | Add a new axis (dimension) at a specified position.             | np.expand_dims([1,2], axis=0) => array([[1, 2]])                        |
| np.finfo              | Get info of float types (min, max, eps).                        | np.finfo(np.float32).eps  |
| np.flatten            | Flatten a multi-dimensional array into 1D.                      | np.array([[1,2],[3,4]]).flatten() => array([1, 2, 3, 4])                |
| np.flip               | Reverse array elements along an axis.                           | np.flip([[1, 2], [3, 4]]) => array([[4, 3], [2, 1]])                    |
| np.fliplr             | Flip array in the left/right direction.                         | np.fliplr([[1, 2], [3, 4]])   |
| np.flipud             | Flip array in the up/down direction.                            | np.flipud([[1, 2], [3, 4]])   |
| np.floor              | Round each value down to the nearest integer.                   | np.floor([1.8, 2.1]) => array([1., 2.])                                 |
| np.fromfunction       | Construct array from function.                                  | np.fromfunction(lambda i, j: i + j, (2, 2)) => array([[0, 1], [1, 2]])  |
| np.fromiter           | Create array from iterable.                                     | np.fromiter(range(3), dtype=int) => array([0, 1, 2])                    |
| np.genfromtxt         | Load data, allowing missing values.                             | np.genfromtxt('data.csv', delimiter=',')                                |
| np.get_printoptions   | Get current print options.                                      | np.get_printoptions()   |
| np.histogram          | Compute histogram of array.                                     | np.histogram([1, 2, 1])   |
| np.iinfo              | Get limits of integer types.                                    | np.iinfo(np.int32).max  |
| np.intersect1d        | Intersection of two arrays.                                     | np.intersect1d([1,2,3], [2,3,4]) => array([2, 3])                       |
| np.isin               | Check whether each element is in a given set.                   | np.isin([1, 2], [2, 3]) => array([False, True])                         |
| np.isinf              | Return boolean array for ±inf.                                  | np.isinf([1, np.inf]) => array([False, True])                           |
| np.isnan              | Return boolean array for NaNs.                                  | np.isnan([1.0, np.nan]) => array([False, True])                         |
| np.linalg.cholesky    | Cholesky decomposition of a positive-definite matrix.           | np.linalg.cholesky([[2, -1], [-1, 2]])                                  |
| np.linalg.det         | Compute the determinant of an array.                            | np.linalg.det([[1, 2], [3, 4]]) => -2.0                                 |
| np.linalg.eig         | Compute eigenvalues and right eigenvectors of a square array.   | np.linalg.eig([[1, 2], [2, 1]])   |
| np.linalg.inv         | Compute the (multiplicative) inverse of a matrix.               | np.linalg.inv([[1, 2], [3, 4]]) => array([[ -2. ,  1. ], [ 1.5, -0.5]]) |
| np.linalg.matrix_rank | Return matrix rank using SVD.                                   | np.linalg.matrix_rank([[1, 2], [2, 4]]) => 1                            |
| np.linalg.norm        | Vector or matrix norm.  | np.linalg.norm([3, 4]) => 5.0   |
| np.linalg.qr          | Compute the QR decomposition.                                   | np.linalg.qr([[1, 2], [3, 4]])  |
| np.linalg.solve       | Solve a linear matrix equation.                                 | np.linalg.solve([[1, 2], [3, 1]], [5, 6])                               |
| np.linalg.svd         | Singular Value Decomposition.                                   | np.linalg.svd([[1, 2], [3, 4]])   |
| np.linspace           | Create a fixed number of evenly spaced values over an interval. | np.linspace(0, 1, 5) => array([0. , 0.25, 0.5 , 0.75, 1. ])             |
| np.load               | Load array from binary npy file.                                | np.load('arr.npy')  |

# NumPy + Pandas + Matplotlib Mega Cheatsheet

|                |   |   |
|----------------|---|---|
| np.loadtxt     | Load data from a text file.                             | np.loadtxt('data.txt')  |
| np.logical_and | Element-wise logical AND.                               | np.logical_and([True, False], [True, True]) => array([ True, False])  |
| np.logical_not | Invert boolean array elements.                          | np.logical_not([True, False]) => array([False,  True])                |
| np.logical_or  | Element-wise logical OR.                                | np.logical_or([False, False], [True, False]) => array([ True, False]) |
| np.max         | Return the largest element.                             | np.max([1, 2, 3]) => 3  |
| np.maximum     | Element-wise maximum.                                   | np.maximum([1, 3], [2, 2]) => array([2, 3])                           |
| np.mean        | Compute the average value of array elements.            | np.mean([1, 2, 3]) => 2.0   |
| np.median      | Compute median of array.                                | np.median([1, 3, 2]) => 2.0   |
| np.meshgrid    | Generate coordinate matrices from coordinate vectors.   | np.meshgrid([1,2], [3,4])   |
| np.mgrid       | Dense multi-dimensional meshgrid.                       | np.mgrid[0:5, 0:5]  |
| np.min         | Return the smallest element.                            | np.min([1, 2, 3]) => 1  |
| np.minimum     | Element-wise minimum.                                   | np.minimum([1, 3], [2, 2]) => array([1, 2])                           |
| np.mod         | Modulus element-wise.                                   | np.mod([4, 5], [2, 2]) => array([0, 1])                               |
| np.negative    | Element-wise numerical negation.                        | np.negative([1, -2]) => array([-1, 2])                                |
| np.nonzero     | Return indices where elements are non-zero.             | np.nonzero([1, 0, 2]) => (array([0, 2]),)                             |
| np.ogrid       | Open grid for vectorized evaluations.                   | np.ogrid[0:5, 0:5]  |
| np.ones        | Create an array filled with ones of a given shape.      | np.ones((3,)) => array([1., 1., 1.])                                  |
| np.pad         | Pad array with constant or specified mode.              | np.pad([1, 2], (1, 1)) => array([0, 1, 2, 0])                         |
| np.percentile  | Compute nth percentile.                                 | np.percentile([1,2,3], 50) => 2.0                                     |
| np.power       | Element-wise exponentiation.                            | np.power([2, 3], 2) => array([4, 9])                                  |
| np.quantile    | Compute quantiles.                                      | np.quantile([1, 2, 3, 4], 0.25) => 1.75                               |
| np.ravel       | Return a flattened array, returns a view if possible.   | np.ravel(np.eye(2)) => array([1., 0., 0., 1.])                        |
| np.repeat      | Repeat elements of array.                               | np.repeat([1, 2], 2) => array([1, 1, 2, 2])                           |
| np.reshape     | Change the shape of an array without changing its data. | np.arange(6).reshape(2,3) => array([[0, 1, 2], [3, 4, 5]])            |
| np.roll        | Roll array elements along axis.                         | np.roll([1,2,3], 1) => array([3,1,2])                                 |
| np.rot90       | Rotate an array by 90 degrees.                          | np.rot90([[1, 2], [3, 4]]) => array([[2, 4], [1, 3]])                 |
| np.round       | Round elements to the nearest integer.                  | np.round([0.1, 1.9]) => array([0., 2.])                               |
| np.save        | Save array to a binary file (npy format).               | np.save('arr.npy', arr)   |
| np.savez       | Save multiple arrays into a .npz file.                  | np.savez('arrs.npz', a=arr1, b=arr2)                                  |

# NumPy + Pandas + Matplotlib Mega Cheatsheet

|                         |   |   |
|-------------------------|---|---|
| np.set_printoptions     | Configure NumPy print display.                                    | np.set_printoptions(precision=2)                                |
| np.setdiff1d            | Set difference of two arrays.                                     | np.setdiff1d([1,2,3], [2,3]) => array([1])                      |
| np.seterr               | Control how NumPy handles errors (e.g., divide by zero).          | np.seterr(divide='ignore')                                      |
| np.sign                 | Returns sign of each element (-1, 0, or 1).                       | np.sign([-5, 0, 6]) => array([-1, 0, 1])                        |
| np.sort                 | Return a sorted copy of the array.                                | np.sort([3, 1, 2]) => array([1, 2, 3])                          |
| np.sqrt                 | Element-wise square root.   | np.sqrt([1, 4, 9]) => array([1., 2., 3.])                       |
| np.squeeze              | Remove single-dimensional entries from the shape.                 | np.squeeze([[1]]) => array(1)                                   |
| np.std                  | Compute the standard deviation (spread) of elements.              | np.std([1, 2, 3]) => 0.816...                                   |
| np.sum                  | Sum all elements in an array or along an axis.                    | np.sum([1, 2, 3]) => 6  |
| np.tile                 | Repeat array shape.   | np.tile([0,1], (2,2))   |
| np.trace                | Sum along diagonals.  | np.trace([[1,2],[3,4]]) => 5                                    |
| np.transpose            | Permute the dimensions of an array.                               | np.transpose([[1,2,3]]) => array([[1], [2], [3]])               |
| np.tril                 | Lower triangle of an array.                                       | np.tril(np.ones((3, 3)))  |
| np.triu                 | Upper triangle of an array.                                       | np.triu(np.ones((3, 3)))  |
| np.union1d              | Union of two arrays.  | np.union1d([1, 2], [2, 3]) => array([1, 2, 3])                  |
| np.unique               | Return sorted unique elements.                                    | np.unique([1, 2, 2, 3]) => array([1, 2, 3])                     |
| np.var                  | Compute variance.   | np.var([1, 2, 3]) => 0.666...                                   |
| np.where                | Conditionally select elements from arrays.                        | np.where([1, 0, 1], 'yes', 'no') => array(['yes', 'no', 'yes']) |
| np.zeros                | Create an array filled with zeros of a specified shape and dtype. | np.zeros((2, 3)) => array([[0., 0., 0.], [0., 0., 0.]])         |
| pd.concat()             | Concatenate objects along axis.                                   | pd.concat([df1, df2])   |
| pd.df.agg()             | Aggregate multiple functions.                                     | df.agg(['min', 'max'])  |
| pd.df.apply()           | Apply function across rows/columns.                               | df.apply(np.sqrt)   |
| pd.df.at[]              | Fast label-based scalar access.                                   | df.at[0, 'col']   |
| pd.df.columns           | Return column labels.   | df.columns  |
| pd.df.describe()        | Generate descriptive statistics.                                  | df.describe()   |
| pd.df.drop()            | Drop rows or columns.   | df.drop('col', axis=1)  |
| pd.df.drop_duplicates() | Remove duplicate rows.  | df.drop_duplicates()  |
| pd.df.dropna()          | Remove rows with missing values.                                  | df.dropna()   |
| pd.df.dtypes            | Return data types of columns.                                     | df.dtypes   |

# NumPy + Pandas + Matplotlib Mega Cheatsheet

|                      |                                      |  |
|----------------------|--------------------------------------|--|
| pd.df.duplicated()   | Mark duplicate rows.                 | df.duplicated()                              |
| pd.df.fillna()       | Replace NaNs with specified value.   | df.fillna(0)                                 |
| pd.df.groupby()      | Group and aggregate data.            | df.groupby('col').mean()                     |
| pd.df.head()         | Return first n rows of DataFrame.    | df.head(5)                                   |
| pd.df.iat[]          | Fast integer-location scalar access. | df.iat[0, 1]                                 |
| pd.df.iloc[]         | Access rows/cols by position.        | df.iloc[0, 1]                                |
| pd.df.info()         | Print concise summary of DataFrame.  | df.info()                                    |
| pd.df.isnull()       | Detect missing values.               | df.isnull()                                  |
| pd.df.join()         | Join columns of another DataFrame.   | df.join(df2)                                 |
| pd.df.loc[]          | Access rows/cols by labels.          | df.loc[0, 'col']                             |
| pd.df.map()          | Map values using dict/function.      | df['col'].map({1:'A'})                       |
| pd.df.melt()         | Unpivot wide to long format.         | df.melt(id_vars=['A'])                       |
| pd.df.merge()        | Merge DataFrames on key columns.     | df.merge(df2, on='key')                      |
| pd.df.notnull()      | Detect non-missing values.           | df.notnull()                                 |
| pd.df.nunique()      | Count distinct values per column.    | df.nunique()                                 |
| pd.df.pivot()        | Reshape data (wide format).          | df.pivot(index='A', columns='B', values='C') |
| pd.df.query()        | Query using boolean expression.      | df.query('col > 5')                          |
| pd.df.rename()       | Rename index or columns.             | df.rename(columns={'a':'b'})                 |
| pd.df.reset_index()  | Reset index to default.              | df.reset_index()                             |
| pd.df.sample()       | Random sample of rows.               | df.sample(5)                                 |
| pd.df.set_index()    | Set column as index.                 | df.set_index('col')                          |
| pd.df.shape          | Return (rows, columns).              | df.shape                                     |
| pd.df.sort_index()   | Sort by index.                       | df.sort_index()                              |
| pd.df.sort_values()  | Sort by column values.               | df.sort_values('col')                        |
| pd.df.tail()         | Return last n rows of DataFrame.     | df.tail(5)                                   |
| pd.df.to_csv()       | Write DataFrame to CSV file.         | df.to_csv('out.csv')                         |
| pd.df.transform()    | Transform each group.                | df.groupby('col').transform('mean')          |
| pd.df.value_counts() | Count unique values in series.       | df['col'].value_counts()                     |
| pd.read_csv()        | Load CSV file into DataFrame.        | pd.read_csv('data.csv')                      |

# NumPy + Pandas + Matplotlib Mega Cheatsheet

|                                    |                                       |  |
|------------------------------------|---------------------------------------|--|
| <code>plt.annotate()</code>        | Add annotation to plot.               | <code>plt.annotate('Point', xy=(1,1))</code> |
| <code>plt.ax.grid()</code>         | Toggle grid for axis.                 | <code>ax.grid(True)</code>                   |
| <code>plt.ax.legend()</code>       | Show legend for axis.                 | <code>ax.legend()</code>                     |
| <code>plt.ax.plot()</code>         | Plot on a specific axis object.       | <code>ax.plot(x, y)</code>                   |
| <code>plt.ax.set_title()</code>    | Set title on specific axis.           | <code>ax.set_title('Subplot')</code>         |
| <code>plt.ax.set_xlabel()</code>   | Set x-label on axis.                  | <code>ax.set_xlabel('X')</code>              |
| <code>plt.ax.set_ylabel()</code>   | Set y-label on axis.                  | <code>ax.set_ylabel('Y')</code>              |
| <code>plt.axhline()</code>         | Draw horizontal line.                 | <code>plt.axhline(y=0.5)</code>              |
| <code>plt.axhspan()</code>         | Horizontal filled span.               | <code>plt.axhspan(0.25, 0.75)</code>         |
| <code>plt.axvline()</code>         | Draw vertical line.                   | <code>plt.axvline(x=2)</code>                |
| <code>plt.axvspan()</code>         | Vertical filled span.                 | <code>plt.axvspan(1, 2)</code>               |
| <code>plt.bar()</code>             | Bar chart.                            | <code>plt.bar(x, height)</code>              |
| <code>plt.barh()</code>            | Horizontal bar chart.                 | <code>plt.barh(y, width)</code>              |
| <code>plt.boxplot()</code>         | Box plot.                             | <code>plt.boxplot(data)</code>               |
| <code>plt.errorbar()</code>        | Plot with error bars.                 | <code>plt.errorbar(x, y, yerr=0.2)</code>    |
| <code>plt.fig.add_subplot()</code> | Add subplot to existing figure.       | <code>fig.add_subplot(121)</code>            |
| <code>plt.figure()</code>          | Create new figure.                    | <code>plt.figure(figsize=(6,4))</code>       |
| <code>plt.fill_between()</code>    | Fill area between curves.             | <code>plt.fill_between(x, y1, y2)</code>     |
| <code>plt.grid()</code>            | Display grid lines.                   | <code>plt.grid(True)</code>                  |
| <code>plt.hist()</code>            | Plot histogram.                       | <code>plt.hist(data, bins=10)</code>         |
| <code>plt.legend()</code>          | Display legend on plot.               | <code>plt.legend()</code>                    |
| <code>plt.pie()</code>             | Pie chart.                            | <code>plt.pie(sizes, labels=labels)</code>   |
| <code>plt.plot()</code>            | Plot y vs. x as lines and/or markers. | <code>plt.plot(x, y)</code>                  |
| <code>plt.plot_date()</code>       | Plot with date values.                | <code>plt.plot_date(dates, values)</code>    |
| <code>plt.savefig()</code>         | Save figure to file.                  | <code>plt.savefig('plot.png')</code>         |
| <code>plt.scatter()</code>         | Scatter plot of x vs. y.              | <code>plt.scatter(x, y)</code>               |
| <code>plt.show()</code>            | Display the plot.                     | <code>plt.show()</code>                      |
| <code>plt.subplot()</code>         | Add subplot to figure.                | <code>plt.subplot(2, 1, 1)</code>            |
| <code>plt.subplots()</code>        | Create subplots in figure.            | <code>fig, ax = plt.subplots(2, 1)</code>    |
